SPACE VERSE

UI case study by Matěja Mráková
from UX/Designer
Year: 2025

Background

Spaceverse is an all-in-one app that enables to create songs, organize them into albums, edit lyrics with advanced tools, select beats, and record vocals. Spaceverse also offers multiple platforms for these tasks, users can do everything within Spaceverse.

Problem

The main problem is that creating a song typically requires separate platforms for finding non-profit beats, storing notes and lyrics, generating rhymes, and more. We believe the only single process could be much more efficient and enjoyable.

Goals

Our goal was to offer an app that is go to for young artists when they want to write some lyrics. At the same time, we wanted to offer a platform where they can store all of their songs and organize them into albums.

My Impact

Led the product from zero to one, owning conceptualization, research, UX strategy, end-to-end design, prototyping, and testing.

Research

GOALS

Below are the areas I tried to explore during the research, based on preliminary assumptions:

- Understand the workflow of long-writing processes
- What are the tools I need to build the perfect tools
- The content I which the user uses different tools
- What are the pain points in our platform in the process of long-writing

METHODOLOGIES

To validate the assumptions I had regarding circumstances of long-writing process and related tools, I used:

- Interviews with potential users (5 participants)
- Long-writing in detailed through the prism of time management
- In-depth interviews with merger users who want to optimize their long-writing process

Target User Interviews

Below are quotes that expressed some of the important insights that I gathered during the interviews.

> I use A.I.R different platforms when creating a song. It's annoying having to navigate between them. I believe they should be one platform.

> I sometimes I'm just given a measure and I have the feeling of actually creating something meaningful. Sometimes it gives me the feeling of doing it like a pro.

> I keep my lyrics in Notes app. Sometimes I forget where I put them and I have to search for them. I was using Trello when I gave up.

> I tried out different apps for long-writing but I always ended up using Notes app. It's all that I require (especially for basic features, and for free, and don't know those features.

> I use Lyrics Studio. It's not free, but it's the best app I found so far. It's all that I require (especially for basic features, and for free, and don't know those features.

RESEARCH SYNOPSIS

Learned that most of the target users tend to use multiple apps for long-process, and that they all are at some degree frustrated with it. Also, they are willing to pay for a tool that would fit their needs. For the long-term success, it would be important to focus on the important tools for aspiring songwriters.

PITCH

The insight from the user interviews gave me confidence in the direction I seek to go with this project and to trace that can be addressed with a clear product feature. I built two goals:

Goal 1: Create a tool that would be the most useful for the target audience, that would be able to provide the most value for the time users are complete. Users can then raise the long-long process it with friends.

Goal 2: Offer a tool that would be able to provide the most value for the time users are complete. Users can then raise the long-long process it with friends.

Define

User Persona

After completed the outlines from the research into the affinity map, I was able to create a persona that represents the main user group.

Michael Jordan
Music artist

- 18 years
- Male
- Los Angeles, CA

DESCRIPTION
Michel is a young artist that wants to believe on others on his city. He's able to collage a team and he is very passionate about his lifestyle.

JOBS TO BE DONE
1. Needs to check the training
2. Needs to find a good beat for his lyrics
3. Wants to find a high-quality vocal
4. Wants to find a good place to record his vocals
5. Wants to find a good place to store his lyrics

FRUSTRATIONS
1. Not finding enough time to come up with lyrics from the ancient
2. Finding the right beat, beat platforms, which creates his creative process
3. Finding a good place to store his lyrics

GOALS
1. Wants to be able to create a song in one place
2. Wants to be able to create a song in one place
3. Wants to be able to create a song in one place

User Journey

The user journey was improved by synthesized research from the co-creation analysis and user interviews, allowing us to pinpoint the biggest pain points and what features we were missing.

The MVP enables users to end a new project, write lyrics with specialized tools while playing a beat with the app, and record vocals since the lyrics are complete. Users can then raise the long-long process it with friends.

	Step 1	Step 2	Step 3	Step 4
Task	Long creation	Write lyrics	Record audio	Mixing and mastering
Environment	Indoors	Indoors	Booth	Indoors
Challenges	Sometimes it was hard to find the right beat for my lyrics	It's not always easy to translate ideas into rhyme	Having a great beat, if you is in a noisy area	Most of the lyricists and vocalists aren't producers
Emotions	Inspirational	Doubt, anger	Unsatisfied	Self-criticism
Thoughts	It's the next one, I'm the right one, I'm	It's so hard for me to come up with good lyrics	Am I supposed to record in my cupboard or what?	Hope I can somehow be potato my song
Opportunity	An app beat finder (phone)	User interface with different tools for rhyming	Noise cancellation AI tools	An app connecting with producers

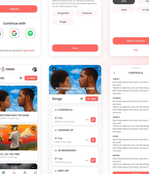
Ideate

Feature Prioritization

After seeking what solution would be the most value for my users, I decided to take a step further and brainstorm the ideas for the upcoming features. I used the Impact vs. Effort matrix to map out the ideas and to prioritize the most valuable features for the first version below. The lesson I just provided me with enough info to determine which features will bring me to high impact in the user.

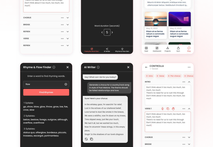
App Navigation

Based on the user task flows and feature roadmap, I designed the simple app map that's functional and easy to navigate.



Wireframes

Key features of creating a project, including lyrics, recording sections, beat management, and collaboration, organized in logical sequence. This ensures the number of decisions for user sessions, allowing me to focus on creating the high-fidelity interface.



Design

UI Kit

Created the UI kit that reflects Spaceverse's brand objectives.

COLOR PALETTE

FONTS

H1 – Poppins Bold/SemiBold 24
H2 – Poppins SemiBold 20
H3 – Poppins Medium 16

Test

Usability Testing

With limited time, I decided to focus on testing to validate the overall experience, ensure clarity of the product's purpose, and confirm that core features are easy to use and perform effectively and without friction.

I conducted 5 moderated usability tests with participants who fit the characteristics of most core across key user flows. The goal was to identify any remaining usability issues and confirm readiness for release.

95%	100%	100%
Task completion rate (completed)	Error-free completion rate (without mistakes)	Completion rate (without assistance)

Future Upgrades

While the testing phase confirmed that the product is ready for launch, it also highlighted opportunities for future iteration and expansion. The following upgrades would enhance the user experience and increase the product's value, but they are not critical for the initial release. Incoming user needs. These improvements are intended to scale such a collaborative foundation rather than address usability issues.

Conclusion

The testing process proved a critical role in validating key design decisions and ensuring a high level of usability post-to-launch. By systematically addressing user feedback and observed behaviors, the final experience achieves clarity, consistency, and confidence across core interactions.

This process reinforced the value of iterative validation and evidence-based design, ensuring that the product moves forward with minimal usability risk and a strong user-centered foundation.
