FinalFind

UX case study by Nadja Miladenić

Role: UX/UI Designer
Year: 2025

Background

Initial idea of FinalFind was to simplify navigation by enabling users to create custom routes on maps, which they can share to ensure seamless navigation experiences.

Problem

Our main problem was to make an experience as light and useful, that it changes the way people are used to navigate each other. Big part of the research were interviews with users that are not tech-savvy and open to changes, so we had to create real value.

Goals

Since effective navigation drives satisfaction and boosts earnings across all industries, our goal was to offer a tool that saves time and enhances efficiency and professional's profiles. FinalFind should be beneficial both personal and business needs.

My Impact

For this project I validated the need for the original product and leveraged data from the research to create an end-to-end product as a lead designer.

Research

GOALS

Below are the areas I'd like to explore during the research. I want to understand:

- The potential benefits for navigating anyone
- The current ways people are navigating the world's cities
- The current in which the navigation users seek for improvement
- The navigating user's guide during standard interactions, as well as edge cases

METHODOLOGIES

To validate the assumptions I had regarding convenience of a route and exchange liability, I used:

- Discovery research on top products related to navigation, to see what users like and what they miss in current offerings
- In-depth interviews with navigation users who want to optimized their navigation process

Competitive Analysis

Since there are many navigation apps, I decided to focus on those with a large user and community base, to provide the best protection for their users. Discovered that almost all of them are lacking in some of the features, which I'd like to cover after getting premium access.

	Waze	Google Maps	Apple Maps	Sygic GPS	Maps.me	Scenic	Komoot	Strava
Scenic routes	✗	✗	✗	✗	✗	✓	✓	✗
Ad Friendly	✗	✗	✗	✗	✗	✗	✗	✗
Jargon	✗	✗	✗	✗	✗	✗	✗	✗
Photorealistic	✗	✗	✗	✗	✗	✗	✗	✗

No apps offer much of the content aimed at helping the users achieve convenience by the desired journey. So I'd like to see my users for the long-term success, I needed that information. Also, I'd like to see how people would react to features that occur during the process of navigation. So I'd like to see from the user interviews, who could meet that requirement.

Target User Interviews

Below are quotes that represent some of the most important insights that I gathered during the interviews.

> I use Google maps to navigate guests to their destinations, and I would like to navigate guests over the phone when Google maps can no longer help me.
>
> Some of our guests have gotten a bit lost in their journey just because we weren't hand-holding them.
>
> I highly doubt that I would use a digital app to navigate my clients. It would be too incredibly complicated and unfamiliar. I know Garage mentioned that all I ever,

> I would actually like to have a tool that would make it easier for me to navigate my clients to office. That would save me a ton of time.
>
> My clients appreciate my office's and advice, because they usually don't understand the area.
>
> My experience can't be anywhere, found on Google maps, I have a huge problem when I want to come those online.

RESEARCH SYNOPSIS

I was surprised to learn that most of the target users were not tech-savvy and open to changes in navigation apps, to improve their journey. I'd like to discover that while I'm here. Because they want to discover that while I'm here. Because they want to navigate their clients to their destinations, so I'm looking a product that guides them, and making the same thing over and over again.

PIVOT

The insights from the user interviews gave me confidence that there is a need for a product that would provide a route that can be addressed with a tool product features. Location routes or map and photorealistic datasets tools that can be provided anywhere on the route.

Define

User Persona

After completed the outcomes from the research into the affinity map, I was able to create a persona that represents the main user group.

Marta Marcucci
Tour manager

- 40 y.o.
- Milan
- Tour Operator

DESCRIPTION
Marta works as a tour manager from Italy's Lombardy region. She's responsible for Google Maps search, office and location.

A DAY IN LIFE
- Takes a break in the morning
- Checks her emails and Google Maps
- Occasionally has tourists, so she guides them to their destinations
- Goes back home to spend leisure with family

PAIN POINTS
- Anti-tracking and strong GDPR laws
- Tourists are not tech-savvy and open to changes
- Traffic and lack of parking in the city
- Tourists are not tech-savvy and open to changes

DRIVES STRUCTURE

	Step 1	Step 2	Step 3	Step 4
Task Guest navigation	Send location on Google Maps	Tracker on phone for further directions	Pick up guests and arrive at apartments	Stress around
Encouragers	Hotel	Hotel	Car	Apartments
Challenges	Location is not accurate enough	Confusion	Traffic, between then driving	Get back to work on time
Emotions	Doubt	Frustration	Fatigue	Anxiety
Thoughts	Unclear guests will need more instructions	They can't understand me over the phone	Here I go again, spending my time on this	Isn't going to be late, again!
Opportunity	Custom map design	Interface for non-advancement	Driving and walking routes	Detailed end point description

User Journey

The user journey was created by synthesized research from the competitive analysis and user interviews, showing the user's journey from pain points and what features can solve them.

The MVP ultimo tasks to make concise an map guides which sees them for the long-time successes, making guided navigation, and providing a tool that provides a route that can be addressed with a tool product features. Location routes or map and photorealistic datasets tools that can be provided anywhere on the route.

Ideate

Feature Prioritization

After receiving valuable insights from the user for my user's checklists I ideate a way further and brainstorm the ideas for the actual features. I want the app to be easy for user on the go. It requires an easy interface, streamlined navigation and a clear path to the end of the route. The essential features to add enough info to determine which features will bring me to high value to the user.

App Navigation

Based on the user task flows and feature roadmap, I designed the simple app map that's functional and easy to navigate.

Wireframes

The first version of Wi-Fi wireframes allowed me to run early usability tests and discover the points necessary that need to be implemented first. This decreased the number of iterations, which affect both budget and time. Also, I'd like to see how people react to features that occur during the process of navigation. Based on the interviews such as:

- Changing the word "Save" to "Arrival guide", as "Save" makes users hesitate, they want to write users
- Implement arrival guide and guests tracker
- Add a "Back to office" button in case the user doesn't always have internet access
