Background

Friends of Claude is an online only responsive web app enabling creators and fans to exchange artwork from the pure music world. It's a project where I worked on various topics ranging from Product Design to Frontend Tasks. These tasks/roles are needed for an upcoming more about life. Hello. To encourage contributions from celebrities and musicians, we dressed them to look, want which contributions. Therefore, we designed an entire platform.

Problem

As an original concept, we didn't have any competitors, so we performed a comparative analysis search possible. We also couldn't conduct large user interviews because we were on a deadline, and we wanted to surprise the audience with the perfect product. Additionally, there was no need to create an extensive research plan because we already knew what we wanted to do.

Goals

Our goal was to create a student and creator-focused platform on which our specific users can inspire each other and be focused on delivering the best creations in our field. We wanted to give users the freedom to speak on custom subjects, besides the pre-defined ones.

My Impact

I was responsible for Product/system conceptualization and also implementation stages of the project and provided my creative ideas and end product as a lead designer.

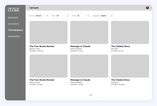
Ideate

Feature Prioritization

After collecting all the ideas it is essential to see what is for users, creators or both. It is a key to time and resources to focus on the actual features. I used the two axis grid to map out the features and prioritize them. Low effort - high value.

App Navigation

Based on the admin and user flow chart below I wanted to keep, compared the whole app that's functional and easy to navigate.

Wireframes


The first version of it will always allowed me to run quite usability tests and discover first priority, bloners that have to be implemented. Without this iterative process of iterations in the design, coding, and all the pitfalls you are creating by it it is hard.
