# FinalFind

UX case study by Marija Mitsikevi

## Shareable arrival guides for precise navigation

**FinalFind** helps hosts and businesses create custom arrival routes with location links creator. It aims to guide visitors to hard-to-find arrival areas.

Role: **UX/UI Designer**
Platform: **Mobile app**
Timeline: **2025-Q1**
Scope: **Research, UX Flows, High-Fidelity UI, prototyping, usability testing**

### Problem

Location pins don't solve the "last 100 meters."
Hotels, apartments, offices and rentals lose time due to:

- **repeated phone calls** (where do I go now?)
- **frustrated guests**
- **lost deliveries**
- **poor first impressions**

### DESIGN CHALLENGE

How might we help businesses provide clear, repeatable arrival instructions, without forcing users to switch their navigation habits?

### Outcome

Designed a lightweight "arrival guide" experience that reduces confusion and repeat calls, improving guest experience for locations that are difficult to find.

### Goals & Success Metrics

**GOALS**

- Enable hosts to create an arrival guide in minutes
- Let visitors follow steps quickly under stress
- Make guides repeatable and shareable via link
- Support non-tech-savvy users

**SUCCESS METRICS**

- Users can complete a guide with no help
- Visitors can find the correct place using the route without calling
- Sharing experience is simple: "Copy link → send"

## Research

**APPROACH**

- **competitive analysis** of navigation + hospitality tools
- **interviews with users** who frequently host visitors/customers

### Competitive Analysis

| | Universal Links | Deep links | Maps sharing | Location sharing | Guest apps | Kiosk / QR | Hospitality platforms | Delivery / logistics |
|---|---|---|---|---|---|---|---|---|
| Smart Guide | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ |
| myTHOLD. | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ |
| stayer | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ |
| FloridaFights | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ |

### Target User Interviews

Below are two user flows, represent some of the most important insights that I gathered during the interviews.

I use Google maps to navigate guests to my apartments. It's a pleasant experience for the navigation part, but I struggle with the pins where Google places them on Google maps.

Some of our guests have given us below 1 star reviews, just because we were hard to find.

I highly doubt that I would use a digital app for navigation, I'm more of a pen and paper (including physical guides) person. I'm in the age between 40-50 years.

I would actually like to have a link that I can send to my clients when they need to come to my office. That would save me a lot of time.

My clients appreciate my effort and advice, however they usually don't understand me as they're...

My apartment is in a complex, found on Google maps, but it's difficult to find. Guests usually need to enter the gate, drive...

**RESEARCH SYNOPSIS**

Interviewed most one of the target users tend to conform to a way, and have their time on navigating guests, by sending them a link to a location, which they have used in the past. This tend to be obscure that what would "Maps" or "Google maps" not be able to locate. Also, the pins can be imprecise and lead guests arrive, and sharing the same thing over and over again.

**PRODUCT DIRECTION**

The insights from the user flows interviews gave me confidence in the direction I wanted to go with this project and a need for a lightweight navigation tool that helps users share custom routes or map and photo instructions. Hosts value time and prevent confusion, the tool should be quick to use.

## Define/ideate

### User Persona

After completing the outcomes from the research into the affinity map, I was able to create a persona that represents the main user group.

**Marija Mazkanji**
Apartment manager

- 50
- Married
- Kids, Homepage

**DESCRIPTION**

Marija comes up to hotel manager from Sirio B. He also heavily supervised the user. 15 years, and has been working in the hospitality industry. He spent twenty...

**A DAY IN LIFE**

- Wakes up around 6 in the morning
- Takes a break to navigate his guests, sometimes he gets lost himself, so he ends up himself because he can't explain to them where his apartments are located

**FRUSTRATIONS**

- Not having enough time to handle his 9-5 job because of navigation problems
- Not being able to find his apartment and is the apartment is poorly located

**BRANDS WHO USE THIS**

airbnb · Google Maps

### User Journey

The user journey was created by synthesized research from the interviews and user interviews, showing what and the biggest pain points and what features are valuable them.

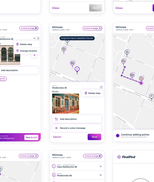
| | Step 1 | Step 2 | Step 3 | Step 4 |
|---|---|---|---|---|
| Task<br>Guest navigation | Provide location on Google maps | Communicate detailed directions via calls/messages | Meet guests for the last 100 meters | Repeat every time |
| Challenges | Location is not accurate enough | Confusion | Extra effort and time loss | Chronic pain points |
| Opportunity | Custom map design | Step-by-step custom | Driving and walking routes | Reusable arrival guides |

### Feature Prioritization

After looking at all ideas and sketching the main value for my users, I decided to take a step further and brainstorm the ideas for the arrival features. I want the app to be easy to use in the gig - it requires an easy interface, streamlined navigation and a quick setup process. The feature roadmap includes features that are important for the core flow and adds extra value, but not critical to run. High value to the user.

### App Navigation

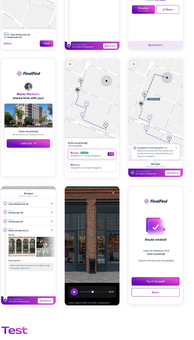
Based on the user task flows and features roadmap, I designed the simple app map that's functional and easy to navigate.



### Wireframes

The first version of lo-fi wireframes allowed me to run early usability tests and discover the priority revisions that need to be implemented ASAP. That also helped the number of iterations to the later versions, with all effort being put into the core flows and features. The second version includes the missing details for the information architecture and interactions such as:

- Change the word "Location" to "Arrival guide", as "Location" implies basic map use is the users
- Implement arrival guide progress bar
- Add a "Save for offline" button in case the user doesn't always have internet access



## Design

### UI Kit

I created the UI kit that reflects FinalFind's brand aspectsus. As the name of the app is FinalFind , it helps the user navigate and find what they want, with ease.

**COLOR PALETTE**

**FONTS**

H1 - Montserrat Bold/SemiBold 24
H2 - Montserrat SemiBold 20
H3 - Montserrat Medium 18
Body - Montserrat Regular/Medium 16
Info - Montserrat Regular 14

**BUTTONS**

**ICONS**

### High-Fidelity Prototype

Prototype link:
https://www.figma.com/design/kmxzVEJ3ZcNMEFKQ5cZFFl/Landing-Page-and-Prototype?node-id=0-1&t=Ow1ecJ0ZTqqqqqqq-1&scaling=min-zoom&content-scaling=fixed&page-block=1&page-block-hide-ui=1&hotspot-preview=1&hotspot-hide-ui=1&hotspot-preset=iphone-portrait&hotspot-frame=Welcome%20Screen&hotspot-node-id=1:1&hotspot-scaling=fit&hotspot-content-scaling=fixed&hotspot-preset-id=1:1&hotspot-frame-id=1:1&hotspot-preset-id=1:1

## Test

### Usability Testing

I created a prototype in Figma and asked participants with 0 users to determine the necessary revisions to make the overall experience more intuitive, clear and enjoyable.

| 100% | 100% | 80% |
|---|---|---|
| Tasks completed | Correctly identified the point of product | Correctly identified color coding for map pins |

Insights gathered from the usability tests and interviews:

- Participants found the app easy to use and understand in the tasks
- **Fix:** Adding a progress bar for arrival guides
- **Fix:** Added copy explaining what an arrival guide or starting point is
- Users may have issues remembering the directions when navigating on map
- **Fix:** Added a "Save for offline" button in case the user doesn't always have internet
- Only one participant mentioned using a third-party app instead of what's suggested
- **Fix:** Added attributes back to the images, videos and audio for optimized comprehension

## Conclusion

While working on this project, I learned hard to really trust the research and discovery process. I started working in it with a very specific idea in mind, and it was very hard to let go of it when the research showed that it wasn't the best approach for the user. Review and the value of testing the prototype in its goals to have the general ideas and hypotheses but the process of the ideas evolution can take as much further.
